

FIELD NOTES
Illinois State Geological Survey

1027. c4
September 7, 1927

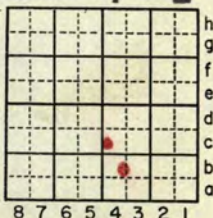

- III Outcrop knobby limestone along creek south of Hanover School - at about altitude 520.
Limestone 5-6' thick - resembles Pottsville knobby = Vermont limestone and also knobby limestone below No. 5 in Rushville area.
Car es - numerous large Fusulinids.
Near road get boulders of earthy limestone - with Fusulinids - looks much like cap No.6 - but no coal.
Above limestone exposed dark gray fireclay like shale which apparently is at least 5' thick.
Old shaft at limestone outcrop - depth to coal - uncertain - reported about 20' below top of limestone
- VI Spec. Fusulina - for L.G.H.
- VII Suggest probably- knobby limestone below No.5 - If so what is coal ?

b4

- II Outcrop coal on west bank creek - just above junction

- VII Suggest probably coal below 5?
Little down stream - coal 14" - underlain by 6'+ shale. Upper 3-4' with Stigmara impressions.
Dip NW 2-3°
