(0534.5g)

November 2, 1927

Outcrop in right bank of creek 40' long and 3' thick;
water level to 3' above.

Shale, light brown, silty, micaceous. Many loose
blocks of hard calcareous sandstone, probably
not far from in place. Estimated elevation
water level 595'.

Went up stream 2300' (NNW). With the exception of
the first 200' bed of creek seems to be in till
and stream deposits all the way. Numerous slabs
and blocks of limestone in stream drift.

Talked with two natives who report numerous coal
diggings. One of these is said to be in W.
bank of creek just traversed in the NE/4 of NW/4
of section 34. Also there are some to the S.
on Andrew's land in Greene County 0204, NW/4.
They say coal outcrops S. of bridge along creek
in section 34.

250' SSE of bridge peculiar relations were observed
between shale and hard rock.
