## INDEX

K5

Section Face 1<sup>st</sup> G off West 3000' from shaft.

1 Coal is hard, very bright and tough. Bed has about same appearance from top to bottom. Coal shoots in chunks, not in sheets. Is banded, glance coal layers do not stand out as matrix is bright. Mother coal partings softer towards top, fairly solid towards bottom. Amount of sulphur small, occurs in knife edges and thin bands. A few thin layers and lenses of mother coal free from sulphur occur.

Bottom coal is hardest, is slightly boney due to thin partings of bone, also contains thin lenses of mother coal mixed with sulphur.

Thickness 6'-0"

2. Floor a dark gray fire clay containing considerable carbon.

I

Roof a very black sheety slate, filled with concretions of all sizes, up to several feet in diameter, also plate of, and fossils replace by sulphur. The concretion frequently projects from the roof down into the coal, giving the roof a very irregular appearance. When they extend into the coal, the coal is always best around it.

I

Contact between coal and black slate is generally an inch or so of black slate and coal stringer. Parts of the mine however have a very sharp line.

I

The slate which is very hard and compact contains thin sulphur lenses parallel to bedding, these weather white giving the shale a white streaked appearance.
